Orthogonal Complements

Orthogonal Complement

The **orthogonal complement** of a nonempty subset $\mathcal{S}$ of $\mathbf{R}^n$, denoted by $\mathcal{S}^\perp$ (read "$\mathcal{S}$ perp"), is the set of all vectors in $\mathbf{R}^n$ that are **orthogonal** to every vector in $\mathcal{S}$. That is,

$$\mathcal{S}^\perp = \{\mathbf{v} \in \mathbf{R}^n \mid \mathbf{v} \cdot \mathbf{u} = 0, \forall \mathbf{u} \in \mathcal{S}\}.$$

Properties of Orthogonal Complements

1. The orthogonal complement of any nonempty subset of $\mathbf{R}^n$ is a subspace of $\mathbf{R}^n$.
2. For any nonempty subset $\mathcal{S}$ of $\mathbf{R}^n$, we have $\mathcal{S}^\perp = (\text{Span } \mathcal{S})^\perp$. In particular, the orthogonal complement of a basis for a subspace is the same as the orthogonal complement of the subspace.
3. For any matrix A, the orthogonal complement of the row space of A is the null space of A; that is

$$(\text{Row } A)^\perp = \text{Null } A.$$

Orthogonal Projections (1/2)

Orthogonal Decomposition Theorem

Let W be a subspace of $\mathbf{R}^n$. Then, for any vector $\mathbf{u}$ in $\mathbf{R}^n$, there exist unique vectors $\mathbf{w}$ in W and $\mathbf{z}$ in $W^\perp$ such that $\mathbf{u} = \mathbf{w} + \mathbf{z}$. In addition, if $\{\mathbf{v}_1, \mathbf{v}_2, \cdots, \mathbf{v}_k\}$ is an orthonormal basis for W, then

$$\mathbf{w} = (\mathbf{u} \cdot \mathbf{v}_1)\mathbf{v}_1 + (\mathbf{u} \cdot \mathbf{v}_2)\mathbf{v}_2 + \cdots + (\mathbf{u} \cdot \mathbf{v}_k)\mathbf{v}_k.$$

Property

For any subspace W of $\mathbf{R}^n$, $\dim W + \dim W^\perp = n$.

Orthogonal Projection

Let W be a subspace of $\mathbf{R}^n$ and $\mathbf{u} \in \mathbf{R}^n$. The **orthogonal projection of u on** W is the unique vector $\mathbf{w}$ such that $\mathbf{u} - \mathbf{w} \in W^\perp$.

Closest Vector Property

Let W be a subspace of $\mathbf{R}^n$ and $\mathbf{u}$ be a vector in $\mathbf{R}^n$. Among all vectors in W, the vector **closest** to $\mathbf{u}$ is the **orthogonal projection** of $\mathbf{u}$ on W.

Orthogonal Projections (2/2)

Orthogonal Projection Operator

The function $U_W : \mathbf{R}^n \to \mathbf{R}^n$ such that $U_W(\mathbf{u})$ is the orthogonal projection of $\mathbf{u}$ on W for every $\mathbf{u} \in \mathbf{R}^n$ is called the **orthogonal projection operator** on W.

Orthogonal Projection Matrix

The standard matrix of orthogonal projection operator U_W on a subspace W of $\mathbf{R}^n$ is called the **orthogonal projection matrix** for W and is denoted as P_W.

Theorem for the Orthogonal Projection Matrix

Let C be an $n \times k$ matrix whose columns form a basis for a subspace W of $\mathbf{R}^n$. Then

$$P_W = C(C^T C)^{-1} C^T.$$

Eigenvalues and Eigenvectors

Eigenvalues and Eigenvectors

$R^n \to R^n$

- Let T be a linear operator on $\mathbf{R}^n$. A nonzero vector v in $\mathbf{R}^n$ is called an **eigenvector** of T if $T(v)$ is a multiple of v, that is,

$$T(v) = \lambda v$$

  for some λ. The scalar λ is called the **eigenvalue** of T that corresponds to v.

- Let A be an $n \times n$ matrix. A nonzero vector v in $\mathbf{R}^n$ is called an **eigenvector** of A if

$$Av = \lambda v$$

  for some scalar λ. The scalar λ is called the **eigenvalue** that corresponds to v.

Diagonalizability

Diagonalizability

An $n \times n$ matrix A is called **diagonalizable** if $A = PDP^{-1}$ for some diagonal $n \times n$ matrix D and some invertible $n \times n$ matrix P.

Diagonalizability and Eigen-decomposition

a. An $n \times n$ matrix A is diagonalizable if and only if there is a basis for $\mathbf{R}^n$ consisting of eigenvectors of A.

   找得到 n 組 L.I. 的 eigenvector conducting a basis

b. If $P \in \mathbf{R}^{n \times n}$ invertible and $D \in \mathbf{R}^{n \times n}$ is diagonal , then

$$A = PDP^{-1}$$

   D上的 components 為 eigenvalue

   if and only if the columns of P are a basis for $\mathbf{R}^n$ consisting of eigenvectors of A and the diagonal entries of D are the eigenvalues corresponding to the respective columns of P.

Diagonalizable : If we can find $A p_1 = \lambda_1 p_1$

$$A p_2 = \lambda_2 p_2$$

$$\vdots$$

$$A p_n = \lambda_n p_n$$

$$\Rightarrow \underbrace{A[p_1\ p_2 \cdots p_n]}_{P\ \text{matrix}} = [\lambda_1 p_1\ \lambda_2 p_2 \cdots \lambda_n p_n]$$

$$= [p_1\ p_2 \cdots p_n] \underbrace{\begin{bmatrix} \lambda_1 & 0 & \cdots & 0 \\ \vdots & \lambda_2 & & \vdots \\ & & \ddots & \\ 0 & \cdots & & \lambda_n \end{bmatrix}}_{D\ \text{matrix}}$$

$$\Rightarrow \cancel{APP^{-1}} = PDP^{-1} \Rightarrow A = PDP^{-1}$$

Orthogonal Diagonalizability

Orthogonal Matrix

A matrix P is called an **orthogonal matrix** if $P^TP = I_n$. $P^{-1} = P^T$

Orthogonal Diagonalizability

An $n \times n$ matrix A is called **orthogonally diagonalizable** if $A = PDP^{-1}$ for some diagonal $n \times n$ matrix D and some $n \times n$ orthogonal matrix P.

- If A is orthogonally diagonalizable, then $A = PDP^{-1} = PDP^T$.
  $A = PDP^T$有意義需要他
- Then, we have $A^T = (PDP^T)^T = PD^TP^T = PDP^T = A$, i.e, A is symmetric. 為 symmetric
- Conversely, if $A \in \mathbf{S}^n$, then A is orthogonally diagonalizable.
- There exists an orthonormal basis of $\mathcal{B}$ for $\mathbf{R}^n$ in which every vector is an eigenvector of A.

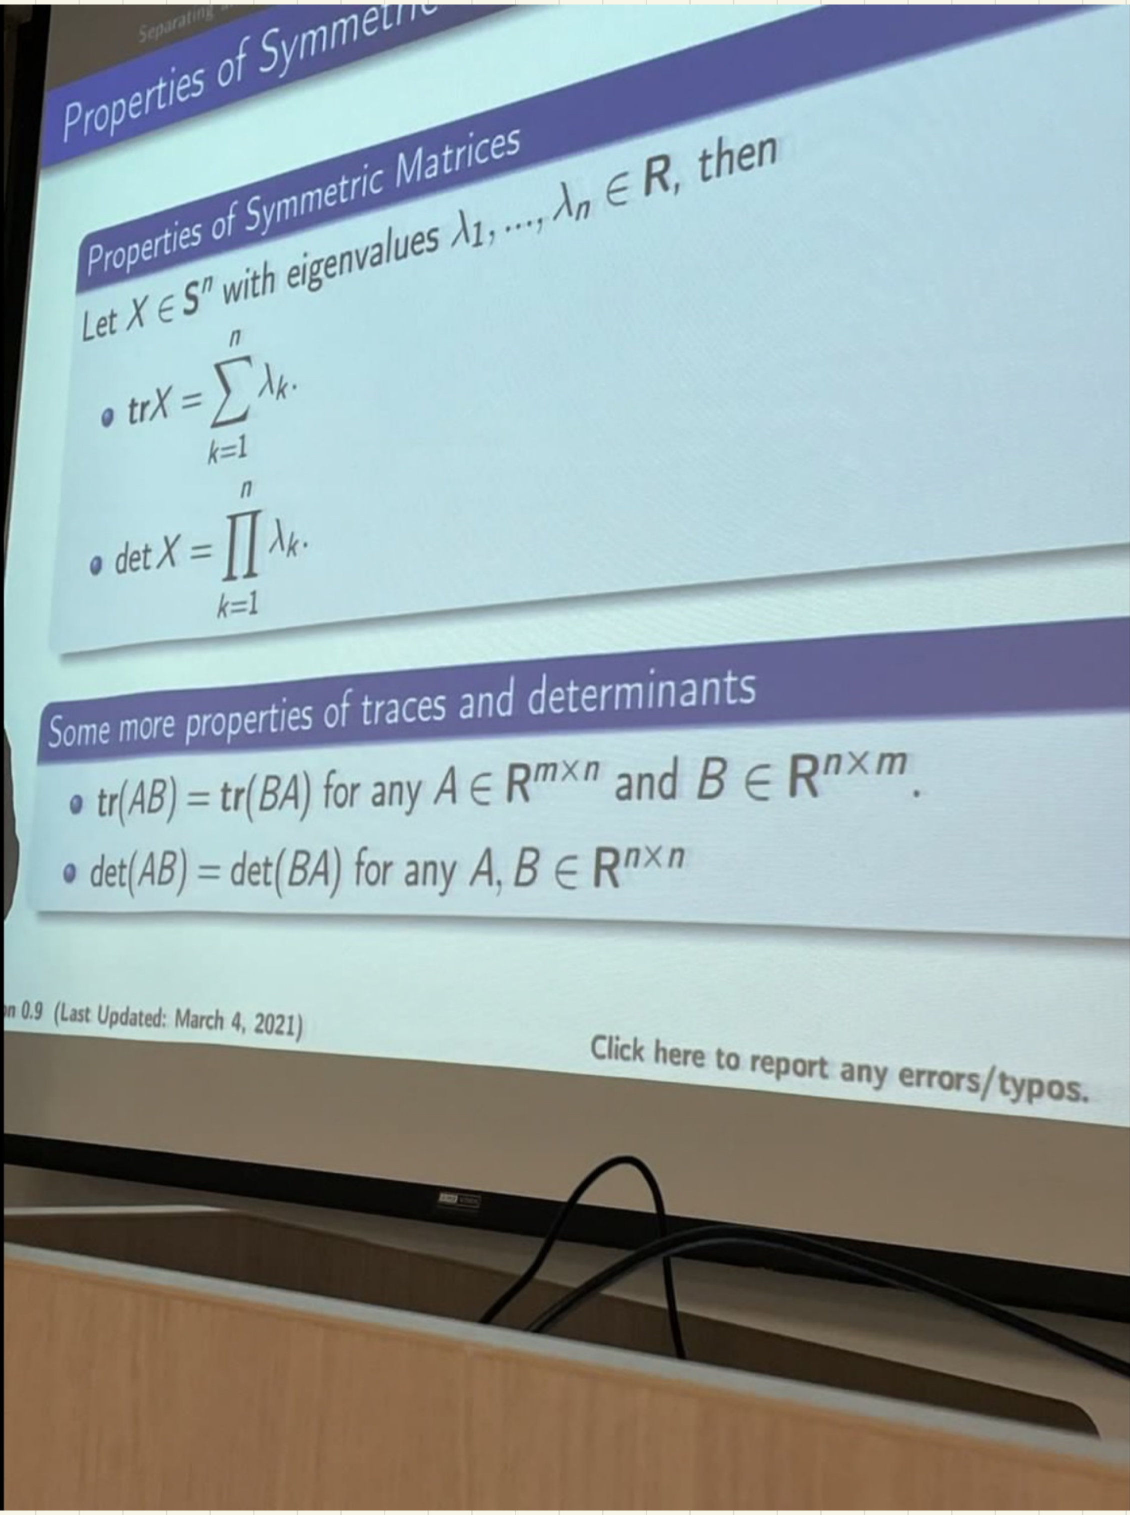
Properties of Symmetric Matrices

- Let $A \in \mathbf{S}^n$. Then there exist a diagonal matrix D and an orthogonal matrix P such that
$$A = PDP^T.$$
- For any $n \geq 1$, we have
$$A^n = \underbrace{(PDP^T)(PDP^T)\cdots(PDP^T)}_{n \text{ times}} = \cdots = PD^nP^T.$$
- If $A \in \mathbf{S}_+^n$, then all diagonal entries of D are nonnegative, i.e., $D = \mathbf{diag}\left([\lambda_1, \cdots, \lambda_n]^T\right)$ where $\lambda_i \geq 0$ for all i. i.e. positive semidefinite S_+

Square root of a (positive semidefinite) symmetric matrix

We define $D^{1/2} = \mathbf{diag}\left([\lambda_1^{1/2}, \cdots, \lambda_n^{1/2}]^T\right)$ and
$$A^{1/2} = PD^{1/2}P^T.$$

$A^{\frac{1}{2}} \cdot A^{\frac{1}{2}} = PD^{\frac{1}{2}}\cancel{P^T P}D^{\frac{1}{2}}P^T$
$= PDP^T$



Separating
Properties of Symmetric
Properties of Symmetric Matrices
Let $X \in \mathbf{S}^n$ with eigenvalues $\lambda_1, \dots, \lambda_n \in \mathbf{R}$, then
$\operatorname{tr} X = \sum_{k=1}^{n} \lambda_k$.
$\det X = \prod_{k=1}^{n} \lambda_k$.
Some more properties of traces and determinants
$\operatorname{tr}(AB) = \operatorname{tr}(BA)$ for any $A \in \mathbf{R}^{m\times n}$ and $B \in \mathbf{R}^{n\times m}$.
$\det(AB) = \det(BA)$ for any $A, B \in \mathbf{R}^{n\times n}$

Norms

Norms

A function $f : \mathbf{R}^n \to \mathbf{R}$ (with $\mathbf{dom}\, f = \mathbf{R}^n$) is called a **norm** if for any $x, y \in \mathbf{R}^n$, $t \in \mathbf{R}$, we have

- $f(x) \geq 0$ (f is nonnegative).
- $f(x) = 0$ only if $x = 0$ (f is definite). 只有在x為0時norm為0(某種程度上norm還是在找與原點的距離)
- $f(tx) = |t| f(x)$ (f is homogeneous).
- $f(x + y) \leq f(x) + f(y)$ (f satisfies the triangle inequality).

ℓ_p-norm

Let $p \geq 1$. Then the **ℓ_p-norm** is defined as

$$||x||_p = (|x_1|^p + \cdots + |x_n|^p)^{1/p}.$$

Question: When $p < 1$, is $||x||_p$ still a norm? NO! not satisfy the triangle inequality

Examples of ℓ_p-norm

- When $p = 2$, the ℓ_2-norm is actually the Euclidean norm:

$$||x||_2 = (x_1^2 + \cdots + x_n^2)^{1/2}.$$

assume $|x_1|$ is max

- When $p = 1$, the ℓ_1-norm is the sum-absolute-value:

$$||x||_1 = |x_1| + \cdots + |x_n|.$$

$$= \lim_{p\to\infty} \left(|x_1|^p \left[1 + \frac{|x_2|^p}{|x_1|^p} + \cdots + \frac{|x_n|^p}{|x_1|^p} \right] \right)^{\frac{1}{p}}$$

$$= \lim_{p\to\infty} (|x_1|^p)^{\frac{1}{p}} = |x_1|$$

- When $p \to \infty$, the ℓ_∞-**norm** is defined as:

$$||x||_\infty \triangleq \lim_{p\to\infty} ||x||_p = \lim_{p\to\infty} (|x_1|^p + \cdots + |x_n|^p)^{1/p}.$$

It can be shown that $||x||_\infty = \max\{|x_1|, \cdots, |x_n|\}$.

Unit Ball

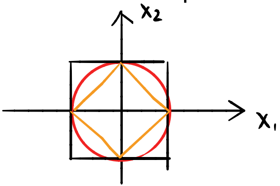
Unit ball

Given a norm $||\cdot||$, the unit ball with respect to the norm is defined as

$$\{x \mid ||x|| \leq 1\}$$ 使 norm ≤1的 set

- What are the unit balls with respect to the ℓ_p-norm with $p = 1, 2, \infty$?

$p = \infty, 2, 1$



P-Quadratic Norms

- For $P \in \mathbf{S}^n_{++}$, the P-**quadratic norm** is defined as

$$||x||_P = (x^T P x)^{1/2} = ||P^{1/2} x||_2.$$

$P=I$, $||x||_P = (x^T x)^{\frac{1}{2}}$
$= ||x||_2$

想成每個方向依 P 的 value 有所不同
norm 也有所不同

  - If rank $P < n$, is $||x||_P$ still a norm? NO! ∵ 可能有 $||x||_P = 0$ when $x \neq 0$
    ⇒ P 必為 ++

- The **unit ball** of a quadratic norm,

$$\{x \in \mathbf{R}^n \mid ||x||_P \leq 1\},$$

is an ellipsoid.

Matrix Norms – Norms Defined On $\mathbf{R}^{m\times n}$ (1/2)

Matrix Norms

A function $f : \mathbf{R}^{m\times n} \to \mathbf{R}$ (with $\mathbf{dom}\ f = \mathbf{R}^{m\times n}$) is called a **norm** if for any $X, Y \in \mathbf{R}^{m\times n}, t \in \mathbf{R}$, we have

- $f(X) \geq 0$ (f is nonnegative).
- $f(X) = 0$ only if $x = 0$ (f is definite). 只有 0 matrix 可以 norm 0
- $f(tX) = |t|f(X)$ (f is homogeneous).
- $f(X + Y) \leq f(X) + f(Y)$ (f satisfies the triangle inequality).

- The **Frobenius norm**, defined on $\mathbf{R}^{m\times n}$, is

$$||X||_F = (\mathbf{tr}(X^T X))^{1/2} = \left(\sum_{i=1}^{m}\sum_{j=1}^{n} X_{ij}^2\right)^{1/2}.$$

- The **sum-absolute-value norm**: $||X||_{\text{sav}} = \sum_{i=1}^{m}\sum_{j=1}^{n} |X_{ij}|$.
- The **maximum-absolute-value norm**: $||X||_{\text{mav}} = \max\{|X_{ij}| \mid i = 1, \cdots, m,\ j = 1, \cdots, n\}$.

Matrix Norms – Norms Defined On $\mathbf{R}^{m \times n}$ (2/2)

Review SVD

- Suppose $||\cdot||_a$ and $||\cdot||_b$ are norms on $\mathbf{R}^m$ and $\mathbf{R}^n$, respectively. The **operator norm** of $X \in \mathbf{R}^{m \times n}$, induced by the norms $||\cdot||_a$ and $||\cdot||_b$, is defined as

$$||X||_{a,b} = \sup\{||Xu||_a \mid ||u||_b \leq 1\}.$$

把 b norm 的 unit ball 投影到 R^m 上取 a norm 的 sup

- If $a = b = 2$, we obtain the **spectral norm** of X, which equals to the maximum singular value of X:

$$||X||_2 = \sigma_{\max}(X) = (\lambda_{\max}(X^T X))^{1/2}.$$

It is also called ℓ_2**-norm** of X.

P.S. Singular value 也是個 matrix norm

Polyhedra 複數

/hI/

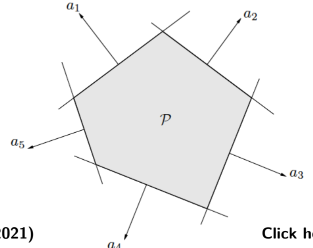
Polyhedron

A **polyhedron** is defined as the solution set of a finite number of linear equations and linear inequalities: ⇒ hyperplane ∩ halfspace

表 hyperplane 表 halfspace

$$\mathcal{P} = \left\{ x \mid a_i^T x \leq b_i,\ i = 1, \cdots, m,\ c_j^T x = d_j, j = 1, \cdots, p \right\}.$$

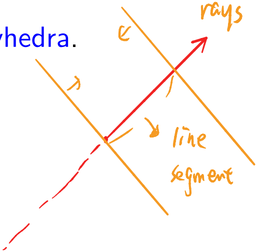
- A polyhedron is the intersection of a finite number of halfspaces and hyperplanes.



Polyhedra

⇒ Intersection也會是convex set

- Polyhedra are convex sets. 任選2點都會在第1, 2, ... n個halfspace內
- Affine sets (including subspaces, hyperplanes, and lines) are polyhedra.
- $\{x+\theta v \mid \theta \geq 0\}$
  Rays, line segments, and hyperplanes are polyhedra.
  可視為half-line
- A bounded[1] polyhedron is called a **polytope**.
  有限大



[1]A subset C of $\mathbf{R}^n$ is called bounded if there exists $B > 0$ such that any $x \in C$ satisfies $|x_i| \leq B$ for any $i \in \{1, 2, \ldots n\}$.

Polyhedra

The polyhedron

$$\mathcal{P} = \left\{x \mid a_i^T x \leq b_i,\ i = 1, \cdots, m,\ c_j^T x = d_j, j = 1, \cdots, p\right\}$$

$d = \begin{bmatrix} d_1 \\ d_2 \\ \vdots \\ d_p \end{bmatrix}$

can be rewritten as

$$\mathcal{P} = \{x \mid Ax \preceq b, Cx = d\}$$

where

$$A = \begin{bmatrix} a_1^T \\ \vdots \\ a_m^T \end{bmatrix} \text{ and } C = \begin{bmatrix} c_1^T \\ \vdots \\ c_p^T \end{bmatrix},$$

and the symbol $\preceq$ denotes **vector inequality** or **componentwise inequality** in $\mathbf{R}^m$: $u \preceq v$ means $u_i \leq v_i$ for $i = 1, \cdots, m$.

Polyhedra – An example

The set of nonnegative numbers

Let $\mathbf{R}_+$ denote the set of nonnegative numbers. Let $\mathbf{R}_{++}$ denote the set of positive numbers.

Nonnegative orthant

The **nonnegative orthant** in $\mathbf{R}^n$ is

象限

$$\mathbf{R}_+^n = \{x \in \mathbf{R}^n \mid x_i \geq 0,\ i = 1, \cdots, n\} = \{x \in \mathbf{R}^n \mid x \succeq 0\}.$$

n條 inequality

- The nonnegative orthant is a polyhedron and a cone (called a **polyhedral cone**).

非負直乘上非負β仍在該 set 內

Simplexes – Another example of polyhedra

Affinely Independent

The $k+1$ points $v_0, v_1, \cdots, v_k \in \mathbf{R}^n$ are called **affinely independent** if $\{v_1 - v_0, \cdots, v_k - v_0\}$ is linearly independent.

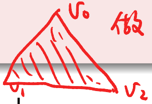
Simplex

Suppose the $k+1$ points $v_0, v_1, \cdots, v_k \in \mathbf{R}^n$ are affinely independent. The **simplex** determined by these $k+1$ points is

$$C = \mathbf{conv}\ \{v_0, \cdots, v_k\} = \left\{\theta_0 v_0 + \cdots + \theta_k v_k \mid \theta \succeq 0, \mathbf{1}^T\theta = 1\right\}$$

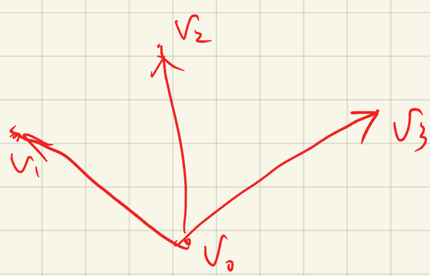
hull

where $\mathbf{1}$ is the vector with all entries one.



- The above defined simplex is sometimes called a ***k*-dimensional simplex in $\mathbf{R}^n$**, since its affine dimension is k.

Affinely Independent :



此三個為 L.I.

Examples of Simplexes

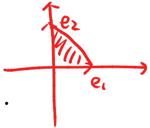
- A 1-dimensional simplex is a line segment.
- A 2-dimensional simplex is a triangle (including its interior).
- A 3-dimensional simplex is a tetrahedron.

Unit Simplex

The **unit simplex** in $\mathbf{R}^n$ is the n-dimensional simplex determined by the zero vector and the unit vectors: $\{0, e_1, \cdots, e_n\}$.

The unit simplex can be expressed as

$$\left\{ x \mid x \succeq 0, \quad \mathbf{1}^T x \leq 1 \right\}.$$



Example of Simplexes – Probability Simplex

- The **probability simplex** in $\mathbf{R}^n$ is the $(n-1)$-**dimensional simplex** determined by the unit vectors $\{e_1, \cdots, e_n\}$. 没有 0
- It can be expressed as

$$\left\{ x \mid x \succeq 0, \;\; \mathbf{1}^T x = 1 \right\}.$$

Q 那就是個 ~~hyperplane~~?

line segment

- Vectors in the probability simplex corresponds to probability distributions on a set with n elements.

Expressing A Simplex as A Polyhedron

- Consider the simplex 細讀!

$$C = \mathbf{conv}\ \{v_0, \cdots, v_k\} = \left\{\theta_0 v_0 + \cdots + \theta_k v_k \mid \theta \succeq 0, \mathbf{1}^T\theta = 1\right\}$$

- Let

$$B = [\ v_1 - v_0 \quad \cdots \quad v_k - v_0\ ] \in \mathbf{R}^{n\times k} \quad \text{L.I.}$$

and $A = \begin{bmatrix} A_1 \\ A_2 \end{bmatrix} \in \mathbf{R}^{n\times n}$ be a nonsingular matrix such that

$$AB = \begin{bmatrix} A_1 \\ A_2 \end{bmatrix} B = \begin{bmatrix} I_k \\ 0_{(n-k)\times k} \end{bmatrix}.$$

A_2 即為B的 orthogonal complement

- Then, we have $x \in C$ if and only if

$$\underbrace{A_2 x = A_2 v_0}_{\text{hyperplane}}, \quad \underbrace{A_1 x \succeq A_1 v_0}_{\text{halfspaces}}, \quad \underbrace{\mathbf{1}^T A_1 x \leq 1 + \mathbf{1}^T A_1 v_0}_{\text{halfspace}}.$$

(a form of a polyhedron)

$$x = \theta_0 v_0 + \theta_1 v_1 + \cdots + \theta_k v_k$$
$$= v_0 + \theta_1(v_1 - v_0) + \theta_2(v_2 - v_0) + \cdots + \theta_k(v_k - v_0)$$
$$= v_0 + [B]\begin{bmatrix} \theta_1 \\ \vdots \\ \theta_k \end{bmatrix}$$

Convex Hull Description of Polyhedra

- Consider the convex hull of the finite set $\{v_1, \cdots, v_k\}$,

$$\begin{aligned} & \mathbf{conv}\{v_1, \cdots, v_k\} \\ = \; & \{\theta_1 v_1 + \cdots + \theta_k v_k \mid \theta_i \geq 0, \; i = 1, \cdots, k, \; \theta_1 + \cdots + \theta_k = 1\} \\ = \; & \left\{\theta_1 v_1 + \cdots + \theta_k v_k \mid \theta \succeq 0, \; \mathbf{1}^T\theta = 1\right\} \end{aligned}$$

- It is a polyhedron and is bounded. (why?) ∵ 是 finite points
- How can we express $\mathbf{conv}\{v_1, \cdots, v_k\}$ in the form

$$\mathcal{P} = \left\{x \mid a_i^T x \leq b_i, \; i = 1, \cdots, m, \; c_j^T x = d_j, j = 1, \cdots, p\right\}?$$

Convex Hull Description of Polyhedra

- Conversely, how do we express a polyhedron

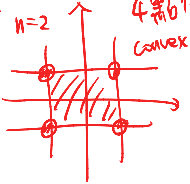
$$\mathcal{P} = \left\{ x \;\middle|\; a_i^T x \leq b_i,\ i = 1, \cdots, m,\ c_j^T x = d_j,\ j = 1, \cdots, p \right\}$$

in the form of convex hull description $\textbf{conv}\,\{v_1, \cdots, v_k\}$?

- Example: consider

if $n=2$

4點做 convex hull



$$C = \{x \mid |x_i| \leq 1,\ i = 1, \cdots, n\}$$

(with $2n$ linear inequalities). Then we have

$x_i \leq 1$, $x_i \geq -1$

$$C = \textbf{conv}\,\{v_1, \cdots, v_{2^n}\},$$

where $v_1, \cdots, v_{2^n}$ are the 2^n vectors whose components are all 1 or -1.

Notations for Sets of Symmetric Matrices

- The notation $\mathbf{S}^n$ denotes the set of symmetric $n \times n$ matrices:

onto mapping

$$\mathbf{S}^n = \left\{ X \in \mathbf{R}^{n \times n} \mid X = X^T \right\}.$$

$S^n \longleftrightarrow R^{\frac{n(n+1)}{2}} \Rightarrow$ isomophism

- $\mathbf{S}^n$ is a vector space with dimension $n(n+1)/2$. 只有 $\frac{n(n+1)}{2}$ 個 entries 是自由的
- The notation $\mathbf{S}^n_+$ denotes the set of symmetric positive semidefinite matrices:

0 matrix

$$\mathbf{S}^n_+ = \{ X \in \mathbf{S}^n \mid X \succeq 0 \}.$$

P.S. $a, b \in R^n$, $a \succeq b \Rightarrow a_i \geq b_i$; $A, B \in S^n$, $A \succeq B \Rightarrow A - B \in S^n_+$

- The notation $\mathbf{S}^n_{++}$ denotes the set of symmetric positive definite matrices:

$$\mathbf{S}^n_{++} = \{ X \in \mathbf{S}^n \mid X \succ 0 \}.$$

Isomorphism of Symmetric Matrix Subspace

Symmetric Vectorization

We define svec : $\mathbf{S}^n \to \mathbf{R}^{n(n+1)/2}$ with **dom** svec $= \mathbf{S}^n$ and

取下△

$$\operatorname{svec}(Y) \triangleq \begin{bmatrix} Y_{11} \\ \sqrt{2}Y_{12} \\ Y_{22} \\ \sqrt{2}Y_{13} \\ \sqrt{2}Y_{23} \\ Y_{33} \\ \vdots \\ Y_{nn} \end{bmatrix} \in \mathbf{R}^{n(n+1)/2}.$$

加$\sqrt{2}$是為了 isometric

希望 norm-preserving i.e. norm at S^n = at $R^{\frac{n(n+1)}{2}}$

可唯一對應

The symmetric vectorization is an isometric isomorphism

It can be shown that svec is an isometric isomorphism:

- $\|\operatorname{svec} X - \operatorname{svec} Y\|_2 = \|X - Y\|_F$.
- $(\operatorname{svec} X)^T \operatorname{svec} Y = \mathbf{tr}(XY)$. Forbbinein Inner product

Positive Semidefinite Cone

Convexity of Positive Semidefinite Cones

The set $\mathbf{S}^n_+$ is a convex cone:
if $\theta_1, \theta_2 \geq 0$ and $A, B \in \mathbf{S}^n_+$, then $\theta_1 A + \theta_2 B \in \mathbf{S}^n_+$.

Proof: We say that A is P.S.D. iff $\forall\, v \in \mathbb{R}^n, v^T A v \geq 0$

$$\forall\, v \in \mathbb{R}^n,\ v^T(\theta_1 A + \theta_2 B)v = \theta_1 (v^T A v) + \theta_2 \underbrace{(v^T B v)}_{\geq 0} \geq 0 + 0 \ (\because \text{PSD})$$

Positive Semidefinite Cone in $\mathbf{S}^2$

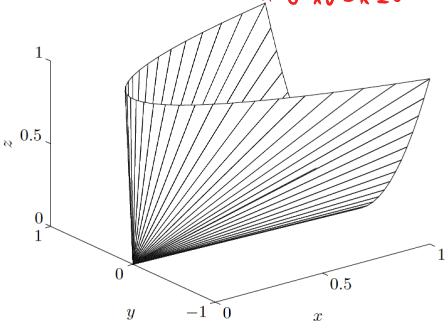
map to R^3 ($R^{\frac{n(n+1)}{2}}$)

$$X = \begin{bmatrix} x & y \\ y & z \end{bmatrix} \in \mathbf{S}^2_+ \iff x \geq 0, \quad z \geq 0, \quad xz \geq y^2.$$

Let $v = \binom{1}{0}$

then $v^T X v = x \geq 0$

Let $v = \binom{0}{1}$



Norm Balls and Norm Cones

Norm Balls and Norm Cones

- Suppose $||\cdot||$ is a norm on $\mathbf{R}^n$.
- It can be shown that a **norm ball** of radius r and center x_c, given by $\{x \mid ||x - x_c|| \leq r\}$, is convex.
- The **norm cone** associated with the norm $||\cdot||$ is the set

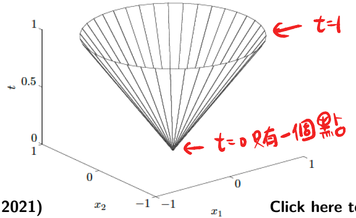
$$C = \{(x, t) \mid ||x|| \leq t\} \subseteq \mathbf{R}^{n+1}.$$

Second-Order Cone

The **second-order cone** is the norm cone for the Euclidean norm, i.e.,

$$\begin{aligned} C &= \left\{ (x,t) \in \mathbf{R}^{n+1} \;\middle|\; \|x\|_2 \le t \right\} \\ &= \left\{ \begin{bmatrix} x \\ t \end{bmatrix} \;\middle|\; \begin{bmatrix} x \\ t \end{bmatrix}^T \begin{bmatrix} I & 0 \\ 0 & -1 \end{bmatrix} \begin{bmatrix} x \\ t \end{bmatrix} \le 0, \quad t \ge 0 \right\}. \end{aligned}$$

It is also known as the quadratic cone, the Lorentz cone, or ice-cream cone.



Intersection Preserves Convexity

Intersection Preserves Convexity

If S_1 and S_2 are convex, then $S_1 \cap S_2$ is convex. finite intersection can be proven by induction

Intersection of an infinite number of sets

If S_α is convex for every $\alpha \in \mathcal{A}$, then

$$\bigcap_{\alpha \in \mathcal{A}} S_\alpha$$

is convex. Here, $\mathcal{A}$ is the set of indices and can be finite or infinite.

- Example: A polyhedron is the intersection of halfspaces and hyperplanes (which are convex), and therefore is convex.

$\forall\ x, y \in S_1 \cap S_2,\quad x, y \in S_1$

$\therefore\ \forall\ \theta \in [0,1],\quad \theta x + (1-\theta) y \in S_1 \text{ — (1)}$

Similarly $\quad \theta x + (1-\theta) y \in S_2 \text{ — (2)}$

$(1)(2) \Rightarrow \theta x + (1-\theta) y \in S_1 \cap S_2$

Positive Semidefinite Cone

Positive Semidefinite Cone

The positive semidefinite cone $\mathbf{S}_+^n$ can be expressed as

infinite ⇒ not polyhedron

$$\bigcap_{z \neq 0} \left\{ X \in \mathbf{S}^n \mid z^T X z \geq 0 \right\}$$

很多 hyperplane 的交集

$$z^T X z = tr(\underbrace{z^T}_{A} \underbrace{X z}_{B}) = tr(X z z^T) = tr(XZ)$$

and is convex.

where $Z = zz^T$

- For each $z \neq 0$, $z^T X z$ is a linear function of X, so the set

$$\left\{ X \in \mathbf{S}^n \mid z^T X z \geq 0 \right\}$$

is a halfspace in $\mathbf{S}^n$.

An Example

- Consider the set

$$S = \{x \in \mathbf{R}^m \mid |p(t)| \leq 1 \text{ for } |t| \leq \pi/3\}$$

  where $p(t) = \sum_{k=1}^{m} x_k \cos kt$.
- The set S can be expressed as the intersection of an infinite number of **slabs**:

$$S = \bigcap_{|t| \leq \pi/3} S_t$$

  where

  halfspace　　　halfspace 他们 associate 的

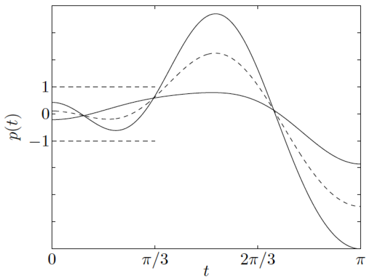
$$S_t = \{x \mid \underbrace{-1 \leq}_{} [\cos t, \cdots, \cos mt]x \underbrace{\leq 1}_{}\}.$$

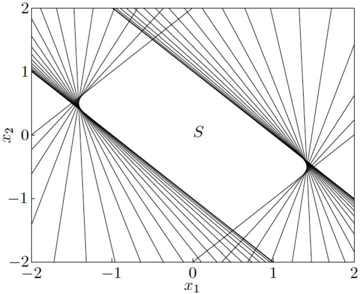
  hyperplane 是 //

  like 

- So, S is convex.

An Example



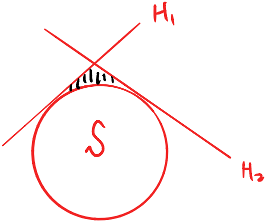


$$p(t) = \sum_{k=1}^{m} x_k \cos kt$$

$S = \bigcap_{|t| \leq \pi/3} S_t$
where $S_t =$
$\{x \mid -1 \leq [\cos t, \cdots, \cos mt]x \leq 1\}$

Convex Sets as Intersection of Halfspaces

- We have seen that the intersection of (possibly infinite) halfspaces is convex.
- It will be shown that a converse is true: every closed convex set S is the intersection of (usually infinite) halfspaces.
- A closed convex set $S \subseteq \mathbf{R}^n$ is the intersection of all halfspaces that contain it: open set 就會有疏漏



$$S = \bigcap_{\substack{S \subseteq \mathcal{H} \subseteq \mathbf{R}^n \\ \mathcal{H} \text{ is a halfspace}}} \mathcal{H}.$$

可能是 infinite

Affine functions

Affine function

A function $f : \mathbf{R}^n \to \mathbf{R}^m$ is **affine** if it is a sum of a linear function and a constant. That is, it has the form

自己証

$$f(x) = Ax + b$$

where $A \in \mathbf{R}^{m \times n}$ and $b \in \mathbf{R}^m$.

Affine functions preserve convexity

Suppose $S \subseteq \mathbf{R}^n$ is convex and $f : \mathbf{R}^n \to \mathbf{R}^m$ is an affine function. Then the **image** of S under f,

$$f(S) = \{f(x) \mid x \in S\},$$

在f(x)取任意之點,
取line segment仍在f(x)內

is convex.

Affine functions

Affine functions preserve convexity

Suppose $S \subseteq \mathbf{R}^n$ is convex and $f : \mathbf{R}^n \to \mathbf{R}^m$ is an affine function. Then the **image** of S under f,

$$f(S) = \{f(x) \mid x \in S\},$$

is convex.

Inverse Image under Affine functions

Suppose $S \subseteq \mathbf{R}^n$ is convex and $f : \mathbf{R}^k \to \mathbf{R}^n$ is an affine function. Then the **inverse image** of S under f,

沒有 inverse 的點也行,

$$f^{-1}(S) = \{x \mid f(x) \in S\},$$

$\because$ ϕ 也是 convex

is convex.

Examples – Scaling, Translation, and Projection

- **Scaling**: If $S \subseteq \mathbf{R}^n$ is convex, then for any $\alpha \in \mathbf{R}$, the set

$$\alpha S = \{\alpha x \mid x \in S\}$$

  is convex.

- **Translation**: If $S \subseteq \mathbf{R}^n$ is convex, then for any $a \in \mathbf{R}^n$, the set

$$S + a = \{x + a \mid x \in S\}$$

  is convex.

- **Projection** onto some coordinates: If $S \subseteq \mathbf{R}^m \times \mathbf{R}^n$ is convex, then

$$T = \{x_1 \in \mathbf{R}^m \mid (x_1, x_2) \in S \text{ for some } x_2 \in \mathbf{R}^n\}$$

  is convex.

Cartesian Products of Sets and Sums of Sets

Cartesian Product of two sets

Suppose $S_1 \subseteq \mathbf{R}^m, S_2 \subseteq \mathbf{R}^n$, then the **Cartesian Product** of S_1 and S_2 is defined as

$$S_1 \times S_2 = \{(x_1, x_2) \mid x_1 \in S_1, x_2 \in S_2\}.$$

- If S_1 and S_2 are convex, then $S_1 \times S_2$ is convex.

Sum of two sets

The **sum** of two sets is defined as

$$S_1 + S_2 = \{x + y \mid x \in S_1, y \in S_2\}$$

where $S_1, S_2 \subseteq \mathbf{R}^n$.

- If S_1 and S_2 are convex, then $S_1 + S_2$ is convex.

Partial Sums of Sets

Partial sum of two sets

The **partial sum** of $S_1, S_2 \subseteq \mathbf{R}^n \times \mathbf{R}^m$ is defined as

$$S = \{(x, y_1 + y_2) \mid (x, y_1) \in S_1, (x, y_2) \in S_2, x \in \mathbf{R}^n, y_i \in \mathbf{R}^m\}.$$

- Partial sums of convex sets are convex.
- Partial sums are general cases for set intersection $(m = 0)$ and set addition $(n = 0)$.

Examples – Polyhedra

m條 inequalities

- The polyhedron $\{x \mid Ax \preceq b\}$ can be expressed as the inverse image of the nonnegative orthant under the affine function $f(x) = b - Ax$:

再看細一點

$$\{x \mid Ax \preceq b\} = \left\{x \mid f(x) \in \mathbf{R}^m_+\right\}.$$

- More generally, the polyhedron $\{x \mid Ax \preceq b,\ Cx = d\}$ can be expressed as the inverse image of the Cartesian product of the nonnegative orthant and the origin under the affine function $f(x) = (b - Ax, d - Cx)$:

Convex set → inverse ⇓ Convex

$$\{x \mid Ax \preceq b,\ Cx = d\} = \left\{x \mid f(x) \in \underbrace{\mathbf{R}^m_+}_{\text{Convex set}} \times \underbrace{\{0\}}_{\text{Convex set}}\right\}.$$

Examples – Ellipsoid

- The ellipsoid

$$\mathcal{E} = \left\{ x \;\middle|\; (x - x_c)^T P^{-1} (x - x_c) \leq 1 \right\},$$

  where $P \in \mathbf{S}^n_{++}$ is the image of the unit Euclidean ball $\{u \mid ||u||_2 \leq 1\}$ under the affine mapping $f(u) = P^{1/2} u + x_c$.
- It is also the inverse image of the unit Euclidean ball under the affine mapping $g(x) = P^{-1/2}(x - x_c)$.

Perspective Functions

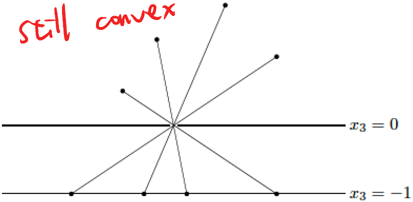
Perspective function

The **perspective function** $P : \mathbf{R}^{n+1} \to \mathbf{R}^n$, with domain $\textbf{dom } P = \mathbf{R}^n \times \mathbf{R}_{++}$, is defined as $P(z, t) = z/t$.

The perspective function can be interpreted as the action of a pin-hole camera.

想成拍照 $\Rightarrow R^3$ map to R^2

still convex



Perspective Functions Preserve Convexity

- Let $C \subseteq \mathbf{dom}\ P = \mathbf{R}^n \times \mathbf{R}_{++}$ be convex, then its image under the perspective function $P : \mathbf{R}^{n+1} \to \mathbf{R}^n$, defined as $P(z, t) = z/t$, i.e.,

$$P(C) = \{P(x) \mid x \in C\}$$

  is also convex.

Proof idea: a line segment in C is mapped to a line segment $P(C)$ under $P(\cdot)$.

Perspective Functions Preserve Convexity

- The inverse image of a convex set under the perspective function is also convex:
- If $C \subseteq \mathbf{R}^n$ is convex, then

$$P^{-1}(C) = \left\{(x, t) \in \mathbf{R}^{n+1} \mid x/t \in C,\ t > 0\right\}$$

is convex.

Linear-fractional functions

- A **linear-fractional function** is formed by composing the perspective function with an affine function.

Linear-fractional functions

Let $g : \mathbf{R}^n \to \mathbf{R}^{m+1}$ be affine:

$$g(x) = \begin{bmatrix} A \\ c^T \end{bmatrix} x + \begin{bmatrix} b \\ d \end{bmatrix},$$

where $A \in \mathbf{R}^{m \times n}, b \in \mathbf{R}^m, c \in \mathbf{R}^n$, and $d \in \mathbf{R}$. The function $f : \mathbf{R}^n \to \mathbf{R}^m$ given by $f = P \circ g$, i.e.,

$$f(x) = \frac{Ax + b}{c^T x + d}, \quad \mathbf{dom}\ f = \left\{ x \mid c^T x + d > 0 \right\},$$

is called a **linear-fractional** (or **projective**) function.

- Affine functions and linear functions are special cases of linear-fractional functions.

Projective Interpretation

- A linear-fractional function can be represented as a matrix

$$Q = \begin{bmatrix} A & b \\ c^T & d \end{bmatrix} \in \mathbf{R}^{(m+1)\times(n+1)}.$$

- The matrix Q maps the point $\begin{bmatrix} x \\ 1 \end{bmatrix}$ to $\begin{bmatrix} Ax+b \\ c^Tx+d \end{bmatrix}$, a scalar multiple of $\begin{bmatrix} f(x) \\ 1 \end{bmatrix}$.

Projective Interpretation

- Let us associate $\mathbf{R}^n$ with a set of rays in $\mathbf{R}^{n+1}$ as follows.
- For any $z \in \mathbf{R}^n$ we associate the (open) ray

$$\mathcal{P}(z) = \left\{ t \begin{bmatrix} z \\ 1 \end{bmatrix} \;\middle|\; t > 0 \right\}$$

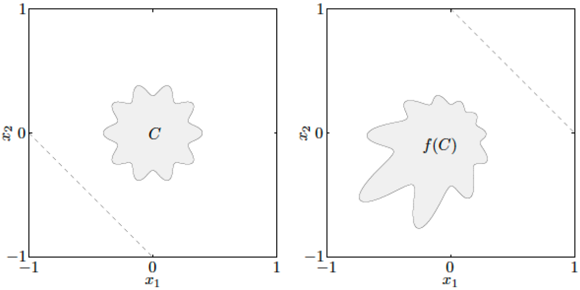
  in $\mathbf{R}^{n+1}$.
- Conversely, any ray in $\mathbf{R}^{n+1}$, with base at the origin and last component which takes on positive value, can be written as $\mathcal{P}(v) = \left\{ t \begin{bmatrix} v \\ 1 \end{bmatrix} \;\middle|\; t \geq 0 \right\}$ for some $v \in \mathcal{R}^n$.
- The correspondence $\mathcal{P}$ is therefore one-to-one and onto.
- The linear-fractional function f can be expressed as

$$f(x) = \mathcal{P}^{-1}(Q\mathcal{P}(x)).$$

Linear-fractional Functions Preserve Convexity

- Linear-fractional functions preserve convexity.
- If C is convex and $C \subseteq \textbf{dom}\ f = \{x \mid c^T x + d > 0\}$, then its image $f(C)$ is convex.
    - Proof idea: $f = P \circ g$ where P is the perspective function and g is an affine function.
- Similarly, if $C \subseteq \mathbf{R}^n$ is convex, then the inverse image $f^{-1}(C)$ is convex.

Linear-fractional Functions – An Example



- A set $C \subseteq \mathbf{R}^2$ and its image under the linear-fractional function

$$f(x) = \frac{x}{x_1 + x_2 + 1}, \quad \mathbf{dom}\ f = \left\{ \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} \middle|\ x_1 + x_2 + 1 > 0 \right\}.$$

Linear-fractional Functions – An Example

- Suppose u and v are random variables that take on values in $\{1, \dots, n\}$ and $\{1, \dots, m\}$, respectively.
- Let $p_{ij} = \textbf{prob}(u = i, v = j)$. Then the conditional probability $f_{ij} = \textbf{prob}(u = i | v = j)$ is

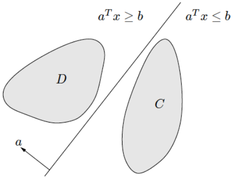
$$f_{ij} = \frac{p_{ij}}{\sum_{k=1}^{n} p_{kj}}.$$

- Then f is obtained by a linear-fractional mapping from p. (what is the mapping?)

Separating Hyperplane Theorem

Separating Hyperplane

The hyperplane $\{x \mid a^T x = b\}$ is called a **separating hyperplane** for the sets C and D, or is said to **separate** the sets C and D if $a^T x \leq b$ for all $x \in C$ and $a^T x \geq b$ for all $x \in D$.



Separating Hyperplane Theorem

Suppose C and D are two convex sets that do not intersect, i.e., $C \cap D = \varnothing$. Then there exist $a \neq 0$ and b such that the hyperplane $\{x \mid a^T x = b\}$ separates C and D.

Separating Hyperplane Theorem – Proof

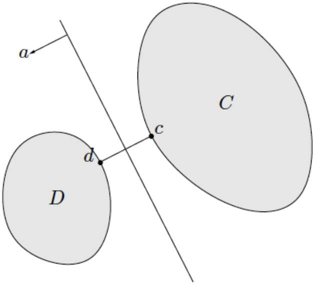
Proof of a special case

- Consider that C and D are both convex, closed, and bounded.
- Assume that the **Euclidean distance** between C and D, defined as

$$\mathbf{dist}(C, D) = \inf\{||u - v||_2 \mid u \in C, v \in D\},$$

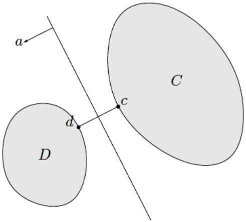
  is positive.
- Since C and D are both closed and bounded, there exist $c \in C$ and $d \in D$ such that

$$||c - d||_2 = \mathbf{dist}(C, D).$$



Separating Hyperplane Theorem – Proof

Proof of a special case



- Let

$$a = d - c, \quad b = \frac{||d||_2^2 - ||c||_2^2}{2}.$$

- Then, it can be shown that the affine function

$$f(x) = a^T x - b = (d-c)^T \left(x - \frac{d+c}{2} \right)$$

is nonpositive on C and nonnegative on D.

Example – A Convex Set and An Affine Set

Matrix 中心

通常可以以參數式寫出

- Suppose $C \subseteq \mathbf{R}^n$ is convex and $D \subseteq \mathbf{R}^n$ is affine, i.e., 參數式 $D = \{Fu + g | u \in \mathbf{R}^m\}$, where $F \in \mathbf{R}^{n \times m}$, $g \in \mathbf{R}^n$.
- Suppose C and D are disjoint, so by the separating hyperplane theorem there are $a \neq 0$ and b such that $a^T x \leq b$ for all $x \in C$ and $a^T x \geq b$ for all $x \in D$. $x = Fu + g$ since $x \in D$
- const. const. $\because a^T x \geq b$ for all $x \in D$, $\therefore a^T Fu \geq b - a^T g$ for all $u \in \mathbf{R}^m$. $\forall u$ holds
- But a linear function is bounded below on $\mathbf{R}^m$ only when it is zero, so we conclude $a^T F = 0$ (and hence, $b \leq a^T g$).
- Thus we conclude that there exists $a \neq 0$ such that $F^T a = 0$ and $a^T x \leq a^T g$ for all $x \in C$.

若 a^TF 為 non-0 vector, $\because$ u 是 any vector $\in R^m$

$\Rightarrow$ $a^TF \cdot u$ 要恆大於某常數. 若 a^TF, u 為同方向則 >0 可行

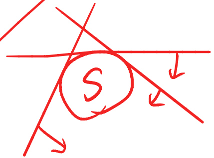
但必然有負方向

$\Rightarrow$ a^TF (視為 slope) 必為 0

Convex Sets as Intersection of Halfspaces (Revisit)

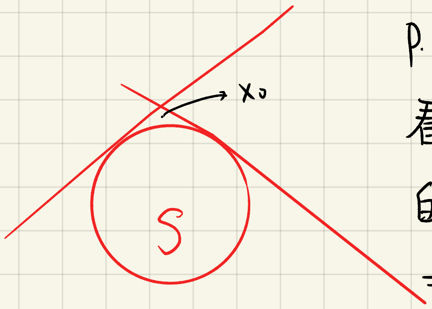
- We have seen that the intersection of (possibly infinite) halfspaces is convex.
- It will be shown that a converse is true: every closed convex set S is the intersection of (usually infinite) halfspaces.
- A closed convex set S is the intersection of all halfspaces that contain it:

$$S = \bigcap_{\substack{S \subseteq \mathcal{H} \subseteq \mathbf{R}^n \\ \mathcal{H} \text{ is a halfspace}}} \mathcal{H}.^{2}$$



S 必可被 (infinite) halfspace intersecting

[2] In the text book, it was written as $S = \bigcap \{\mathcal{H} \mid \mathcal{H} \text{ halfspace}, S \subseteq \mathcal{H}\}$.



P.62 的 proof

Strict Separation of Convex Sets

Strict separation

For two sets $C, D \subseteq \mathbf{R}^n$, if there exists $a \in \mathbf{R}^n, b \in \mathbf{R}$ such that

$$a^T x < b \ \forall x \in C \text{ and } a^T x > b \ \forall x \in D,$$

then C and D are said to be **strictly separable**, and the hyperplane $\{x \mid a^T x = b\}$ is called **strict separation** of C and D.

不保証 strict

- Remark: The separating hyperplane theorem only dictates that two convex sets that are disjoint to be separated by a hyperplane. A strict separation is not guaranteed (even when the sets are closed).

Example – A Point and A Closed Convex Set

直接把 C, $\{x_0\}$ 視為2集合, 可証 Seperate 但不 strict

- Let C be a closed convex set and $x_0 \notin C$. Then there exists a hyperplane that strictly separates $\{x_0\}$ from C.
- Proof idea:

  Regard as Euclean Ball

  - The two sets C and $B(x_0, \epsilon)$ do not intersect for some $\epsilon > 0$.
  - Apply the separating hyperplane theorem on C and $B(x_0, \epsilon)$ (getting a^T and b). $\epsilon \to r$'s
  - The affine function

$$f(x) = a^T x - b - \epsilon ||a||_2/2$$

  strictly separates C and $\{x_0\}$.

x_0 Euclean Ball

C

- Corollary: A closed convex set is the intersection of all halfspaces that contain it.

Converse of Separating Hyperplane Theorems

- Question: If there exists a hyperplane that separates convex sets C and D, does this imply C and D are disjoint? 不一定
  - (No. Consider $C = D = \{0\} \subseteq \mathbf{R}$.)
- Suppose C and D are convex sets, with C open, and there exists an affine function f that is nonpositive on C and nonnegative on D. Then C and D are disjoint.
  - *Hint: f is negative on C.*

Theorem

Any two convex sets, at least one of which is open, are disjoint if and only if there exists a separating hyperplane.

Theorem of alternatives for strict linear inequalities

Theorem of alternatives for strict linear inequalities

Let $A \in \mathbf{R}^{m \times n}$ and $b \in \mathbf{R}^m$. The inequalities

$x \in R^n$, $\lambda \in R^m$, 不同宇宙

恰只有一組有解

$$Ax \prec b$$

找 x

are infeasible if and only if there exists $\lambda \in \mathbf{R}^m$ such that 找 λ

λ 可視為 $C, D \in R^m$, C D disjoint, 的 hyperplane 的法向量

$$\lambda \neq 0, \quad \lambda \succeq 0, \quad A^T\lambda = 0, \quad \lambda^T b \leq 0.$$

這個有解, $Ax \prec b$ 無解

- Proof idea: consider the open convex set

$$D = \mathbf{R}^m_{++} = \{y \in \mathbf{R}^m \mid y \succ 0\}$$

and the affine set (hence convex)

$$C = \{b - Ax \mid x \in \mathbf{R}^n\}.$$

若 C, D disjoint, by seperating hyperplane,

有一個 $\lambda \in A^T\lambda = 0$

Supporting Hyperplanes

Supporting hyperplanes

Suppose $C \subseteq \mathbf{R}^n$, and x_0 is a point in its boundary **bd** C, i.e.,

$$x_0 \in \mathbf{bd}\ C = \mathbf{cl}\ C \backslash \mathbf{int}\ C.$$

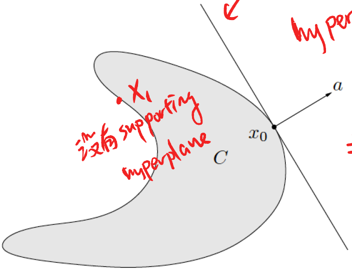
If $a \neq 0$ satisfies $a^T x \leq a^T x_0$ for all $x \in C$, then the hyperplane $\{x \mid a^T x = a^T x_0\}$ is called a **supporting hyperplane** to C at the point x_0.

- This is equivalent to the statement that $\{x_0\}$ and C are separated by the hyperplane $\{x \mid a^T x = a^T x_0\}$.
- The hyperplane is tangent to C at x_0, and the halfspace $\{x \mid a^T x \leq a^T x_0\}$ contains C.

Supporting Hyperplanes

- This is equivalent to the statement that $\{x_0\}$ and C are separated by the hyperplane $\{x | a^T x = a^T x_0\}$.
- The hyperplane is tangent to C at x_0, and the halfspace $\{x \mid a^T x \leq a^T x_0\}$ contains C.

Supporting hyperplane



non-empty

$\Rightarrow$ C是 convex set
必有 Supporting hyperplane

Supporting Hyperplane Theorem

Supporting Hyperplane Theorem

For any nonempty convex set C, and any $x_0 \in \textbf{bd } C$, there exists a supporting hyperplane to C at x_0.

Proof: Use the separating hyperplane theorem.

- If $\textbf{int } C \neq \varnothing$: then by applying the separating hyperplane theorem on $\{x_0\}$ and $\textbf{int } C$, the statement is proved.
- interior
  If $\textbf{int } C = \varnothing$: then C lies in an affine set of dimension less than n. Then any hyperplane that contains this affine set contains both C and x_0 and therefore is a supporting hyperplane.

means
aff hull < n

Converse of the Supporting Hyperplane Theorem

Converse of the Supporting Hyperplane Theorem

If a set C is closed, has nonempty interior, and has a supporting hyperplane at any $x_0 \in \textbf{bd } C$, then C is convex.
